# Tumor heterogeneity across scales

# A Single-Cell Atlas of Breast Cancer Ecosystems

## Richness

How many cell types exist in the tumor ecosystem?

## Abnormality

How much have the tumor cells deviated from non-tumor?

## Individuality

How distinct is the tumor within the cohort?

- Ecosystem-based approach enables **patient stratification**
- Aggressive tumors are **low in richness** and **high in abnormality and individuality**: few, highly abnormal cell subtypes

# Tumors are **spatially** heterogeneous ecosystems

Normal cells

Tumor cells

Immune cells

# Tumors are **spatially** heterogeneous ecosystems

Tumor-tumor interactions:

# Tumors are **spatially** heterogeneous ecosystems

Image from: Hanahan et al., 2022

# Spatial tumor heterogeneity across scales

How do cancer subpopulations interact with each other and the TME?

How do they evade immune destruction and treatments?

How does the TME influence tumor growth?

Spatial heterogeneity as an **opportunity** to enable novel biomarker and therapeutic discovery

# Spatial omics: the new frontier

## Spatial transcriptomics:

e.g., smFISH, MERFISH, seqFISH, LCM, Visium, FISSEQ

## Spatial proteomics:

e.g., mIHC, CycIF, CODEX, ImmunoSABER, IMC, MIBI

Figure from: Lewis *et al.*, *Nature Methods*, 2021

# ATHENA

Analysis of Tumor Heterogeneity  
from Spatial Omics Measurements

## Spatial Omics Datasets

raw data

cell phenotypes

cell masks

## Graph Representation

## Spatial Heterogeneity Quantification

tumor diversity

cell interactions

spatial patterns

## Downstream Analysis

statistical / survival analysis

Implemented in Python
